1/10 Scale Crawler Body

MARAUDER

Can be used with Axial SCX10 Chassis

(Long Wheelbase: 313mm Width: 220mm)

Killerbody's inspiration for MARAUDER originated from Land Rover Defender. As we know that it stands for tough, intrepid, mastering all manner of terrain, it couldn't be more suitable to apply it in rock crawler. The difficulty during the development of MARAUDER lied in the structure design. It was a huge challenge for Killerbody's development and design team to satisfy the classic and tough appearance with vacuum forming technology, which would be unprecedented in history. Finally, Killerbody successfully reproduced this body with our rich experience in body shell design and manufacturing. We believe that you will agree with our design philosophy if you see or touch the MARAUDER.

Undoubtedly, Killerbody's consistent expression techniques of details can be found in many aspects, including cockpit, metal net, special roll bar, roof rack and enhanced light. What's more important is that we are not only working on the appearance, because this body has exceeded the ordinary RC body in many aspects, such as appearance design, structure design, and the complexity of production materials, etc. In addition, we also take

its practicability into consideration. The tote box is used for balancing the weight of the climbing car by putting useful accessories in it and laying the box in the truck bed, thus maintaining the gravity when passing through undulant slopes and greatly improving the car performance.

People may say that the intensity of Polycarbonate body shell is not as good as that of hard plastic body shell. Don't worry.

Killerbody have thought about that already, and Plastic Body Reinforcing Plate has been tailored particularly for it to solve the intensity problem of body shell. Moreover, other upgraded accessories are very powerful as well. Now, you can start your adventurous journey with MARAUDER!

1/10 Scale Crawler Body **WARRIOR**

The Warrior was no doubt inspired by the old Jeep during the World War II. But fans know that the real prototype is M151 MUTT that in 1953 developed by the Ford Motor Company and the U.S. Army. It looked small, compact, rugged, cassette load-carrying structure. These features allowed it to outpoint all other submitted replacement vehicles for the ageing jeep. And it is widely used in the Korean and Vietnam Wars.

Killerbody reproduced this cassette load-carrying structure, and the actual effect is very good, we just make how to reproduce this structure and make it like the real appearance. 1.5MM thick PC material is reasonable allocated to the front, middle, and rear part of this car, and the concave-convex in balance design which not only like the real chair structure, but also make the strength of the whole body shell not lose to any other hard plastic body shell, what's important is don't forgot it use PC material. And like Marauder, Killerbody prepare special anti-rolle bar, many related details and upgrade parts, such as luggage rack, accent light jerry can, roof tent, installation parts for spare tire and so on. People who like the crawler now can drive a Warrior to fight, or when you see Warrior, it can inspire you brave fight hearts.

Can be used with Axial SCX10 Chassis

1/10 Extreme Terrain Truck

MITSUBISHI PAJERO EVO "Mitsubishi Oil" 1998 Dakar Rally

Official Licensed Product

MITSUBISHI PAJERO evo "Mitsubishi Oil"

1998 Dakar Rally - #204 K.AHINOZUKA A+/H.MAGNE O+

1/10 BODY SHELL

Fit for Traxxas 1/10 Telluride 4X4 Truck

Fit for Tamiya 1/10 HILUX HIGH-LIFT 4X4 Truck

Mitsubishi Pajero is a sport-utility vehicle developed and manufactured by Mitsubishi Motors. In 1997, Mitsubishi launched a special road car to celebrate their Dakar rally success, called the Pajero Evolution, it was to form the basis for the 1998 Mitsubishi Dakar rally effort. In the same year, Jean-Pierre Fontenay, driving a Mitsubishi Pajero EVO, won the Paris-Dakar Rally.

Killerbody developed this product to reproduce this classic car, believing that people who love Dakar Rally will like this classic car, which fit for two special chassises of Traxxas 1/10 Telluride 4X4 Truck and Tamiya 1/10 HILUX HIGH-LIFT 4X4 Truck. Besides Killerbody's consistent adherence to the original products, the disassembling method used in the front and rear bumpers makes it looks more authentic with a stronger tactile impression. The rear wing made of piecemeal plastic parts, regardless of the cost, enhances the sense of reality. Besides, the bracket of rear light is made into ABS plastic frames. All these characteristics has reproduced the MITSUBISHI PAJERO EVO 1998 vividly and incisively.

Meanwhile, we launched many upgraded parts for this body. Killerbody's product design philosophy is to make the upgrade parts useful to as many products as possible, rather than only used on a single product. If you have paid attention to our products before, now you will gradually find that some of our previous upgraded parts seem to be designed ahead of time for our current bodies, and this is the in-advance design of Killerbody.

FURIOUS ANGEL

When you first saw "FURIOUS ANGEL", you must be said in your heart that it is crazy. Yes, it is enough flaunt and crazy. Furious Angel was inspired by the popular vans. The car is wildly popular to customize for cruising and is designed from the ground up to match today's active lifestyles. Its spacious interior inspired many people to modify this like your living room or bedroom featuring full out bars, couches and/or beds inside.

Furious Angel is base on the traditional commercial car with Japanese car culture "vanning". Of course you can't forget the crazy vans. These vans that have been modified to the point where they look less like cars and more like the giant robots seen in cartoon films. Although you can spot them from a mile away with all their fins and spoilers, you can usually hear them well before you see them. The drivers of these fans like to install the loudest possible exhaust, big spoilers, wings, body kits, stereo system and a unique set of taillights that is almost crazy!

1/10 BODY SHELL

This body can be used with 1/10 electronic touring car chassis
(Long Wheelbase: 257mm Width: 195mm)

Furious Angel in addition to exaggerate and crazy appearance, Killerboay's design team also design the cockpit for it specifically. Except to make it looks more truly, the design of the cockpit also can enhance the strength of the body. If use our aluminum alloy stealth body mounts, then install on the chassis will become more simply and keep the integrity of the body.

Upgrade Parts for 1/10 RC Car

Smoky Exhaust Pipe W/LED Unit Set

This is an electronic smoky exhaust pipe, which simulates the production of smoke of a real car when the accelerator is pressed. Figure A-B-C show the gradually increasing effects. Its simple installation is demonstrated in Figure 1. Fix the product to the car body with double-sided tape, and link the connecting wire with channel 2 (for moving forward and backward) of the receiver on the chassis as shown in Figure 2, and plug the power cord into the balancing charging port of the batteries in the chassis. Then the installation is finished.

Upgrade Parts for 1/10 RC Car

When Killerbody first designed the ABS tote box, they only thought about balancing the weight of rock crawler body and improving the passing performance. Yet it has brought us unexpected pleasant surprise in the later stage of product design. We found it actually exceeded the scope of RC because it can hold various daily miscellaneous items other than accessories and tools. Finally, Killerbody decided to make it more convenient and practical with a lock catch that is easy to open. In addition, we launched final products with mirror electroplating so that you can use it freely.

Plastic Tote Box

Upgrade Parts for 1/10 RC Car

LED Unit Set Series

This is the SMD chassis light of a newly launched LED light series by Killerbody. The installation is quite simple. You just need to stick it onto the car body. As shown in Figure 1, it can be plugged into the receiving control box of the chassis directly but only for a short time period, because the heat produced by large amounts of light would result in the shedding of reversed glue. The correct way is to use Killerbody's connecting wire to attach with the red plug of SMD LED light, as shown in Figure 2, and then plug it into the LED light control box as Figure 3 displays, this is the best way. The SMD LED lights could be connected in parallel as in Figure 4 when the ports of LED light control box are not enough.

Engine Series

A series of Scale Engines newly launched by Killerbody, which including vertical and transverse types for touring car and modified car. You will feel it incredible when you open the engine bonnet and see so scale engine parts inside. Even though it look very inconspicuous, Killerbody pay much attention on developing it, especially in designing out the curve 3D drawing. Being passionate, with Killerbody's core of producing more real look, high performance finished products, customers can get two different types for selection: one is Clear type DIY by customers, one is Finished type. Once you get a Finished Engine, just trim the outskirts to fit your own RC car and assemble it with 3M double-sided tape, a scale car appears!

Upgrade Parts for 1/10 RC Touring Car

Cockpit & Anti-role Bar

1/10 touring car cockpit set series is another product line uniquely designed and developed by Killerbody. Different from previous, the anti-role bar specially designed for cockpit can adjust the dimension you need according to the different body shell. It looks like a real cockpit when it assembled with RC car driver and other detail parts. The rear-engine cockpit set was designed considering many RC cars using rear-engine; therefore, a lot of factors have been taken into consideration by Killerbody team in earlier development & design stage. Because it is a universal product, what we do in the design is to maximize its universality.

Stealth Body Mounts (Aluminum Alloy)

The body post has been elongated for use in the car body of both tall and dwarf 1:10 touring car, as displayed in Figure A-B, one used on the top and one in the back. As shown in Figure 1, the body post could be installed in the original place of the chassis, or it can be changed into a metal post. As shown in Figure 2, when the body post is installed backward, it will connect with the back of car body. As shown in Figure 3, when the body post is installed forward, it will connect with top of the car body, which is quite simple. The body post and car body are fixed connected with strong magnets, requiring some external force to remove the body.
